Profile

Software engineer specializing in full stack web development, currently completing a B.S. in Computer Science at the New York Institute of Technology one year ahead of the standard track. Sole engineer on a live commerce platform serving a mobile tire service business, building the PostgreSQL data model, the authentication and authorization layer, the Square payment integration, and the transactional email infrastructure, and shipping 3 role-scoped interfaces for customers, workers, and administrators. Concurrently holds a frontend engineering contract building Next.js and headless WordPress applications for agency clients. Both engagements are remote contracts, leaving availability for full time work.

Education

New York Institute of Technology, New York, NY

Bachelor of Science, Computer Science, Specialization in Artificial Intelligence | Expected 2028

Completing the degree one year ahead of the standard four year track.

Completed Coursework: Data Structures; Operating Systems; Computer Networks; Database Management; Computer Organization and Architecture; Elements of Discrete Structures; Digital Logic Design Fundamentals; Computer Programming II

Archbishop Molloy High School, Queens, NY

Graduated 2025

Coursework: AP Computer Science A; CS110; Introduction to Artificial Intelligence

Technical Skills

Languages: JavaScript, Python, Java, SQL, HTML5, CSS3

Frontend: React, Next.js, Vite, Tailwind CSS, component architecture, responsive design, client side state management, REST API integration

Backend and Data: Node.js, Supabase, PostgreSQL, Supabase Edge Functions, Supabase Storage, relational schema design, authentication and authorization, row level security, serverless functions

APIs and Integrations: Square Checkout API, webhook handling, Resend email API, WordPress REST API, Advanced Custom Fields, Google Analytics

Platforms and Tooling: Git, GitHub, Vercel (CI/CD), WordPress, LocalWP, Linux, PyGame

Computer Science Fundamentals: data structures, operating systems, computer networks, relational database management, computer organization and architecture, discrete mathematics, digital logic design

Professional Experience

Full Stack Developer, TireDash Mobile, Pickering, ON | Remote Contract

June 2026 - Present

Mobile tire service company. Sole engineer responsible for the customer facing booking and commerce platform and all internal operations tooling.

- Architected and shipped the company web platform end to end as the only engineer, delivering 3 role-scoped interfaces (customer storefront, worker panel, admin panel) on a React, Vite, Tailwind CSS, Supabase, and Vercel stack selected and configured from scratch.

- Designed and administered the customer PostgreSQL database from an empty schema, covering relational modeling, row level security policies, and account management for customer profiles, credentials, and booking history.
- Built authentication and role based access control across 2 internal panels using Supabase Auth, implementing login, session handling, and row level security so each role reads and writes only the records it owns.
- Engineered the complete checkout flow and integrated the Square Checkout API, handling payment sessions, webhook confirmation, and order state transitions across every step from cart to completed transaction.
- Shipped an admin controlled flash sale toggle that applies promotional pricing across the storefront and checkout in real time, cutting a promotion launch from a developer deploy to a single click for non technical staff.
- Built transactional email infrastructure on Resend and Supabase Edge Functions with capacity for 3,000 messages per month, automating 100 percent of customer facing mail including contact form routing, booking confirmations, and notifications.
- Provisioned and configured the company branded domain email system.
- Instrumented the platform with Google Analytics to measure the booking funnel from landing page through completed checkout.

Frontend Software Engineer, 8Forge Studios, New York, NY | Remote Contract

April 2025 - Present

Digital studio building client web applications on Next.js, React, and WordPress.

- Develop and maintain client web applications in Next.js and React across multiple agency projects, standing up local development environments and shipping features against production WordPress backends.
- Integrate headless WordPress content into React front ends through the WordPress REST API and Advanced Custom Fields, exposing structured content as consumable data for the application layer.
- Use LocalWP to run isolated WordPress environments, shortening turnaround time on client revisions.
- Reduced the duration of a statistics animation sequence by 75 percent on the STFRD client site through dynamic offsetting, preserving the perceived speed of the effect.
- Rebuilt animation playback logic with viewport aware triggering, eliminating repeat playback on scroll re-entry and resolving unintended video playback behavior.
- Exposed 7 new configurable WordPress options to the client, removing developer involvement from routine content and layout changes.

Data Entry Assistant, Lensmasters II, Inc., New York, NY

July to September 2023 and July to September 2024

- Performed daily entry and maintenance of patient records in the company database, reviewing billing entries for accuracy prior to submission.
- Audited and cross referenced patient files to reconcile billing status discrepancies, then filed records by resolved status.
- Handled customer service duties including outbound calls to patients regarding account and billing questions.

Projects

XBACAB Space Shooter | Python, PyGame | 2025

- Built a complete 2D space shooter in 3 days, implementing 4 gameplay systems (boss encounters, power-ups, an in-game shop, and persistent upgrades) on a custom game loop with collision detection and menu, combat, and progression state management.
